ANNOTATION:

This thesis deals with the Czech version of the BPQ (Borderline Personality Questionare) and aims to verify the psychometric properties questionare. I use custom developed data collected in the context of a larger study NÚDZ aimed at needy validation of a questionnaire method of measuring different facets of personality functioning. Detailed analysis of these data, I concluded that the questionnaire is internally consistent, as I stated prior percentile standards and compared the psychometric properties of the Czech version of the original American version.
