

Abstract

Title: The effect of the place of the match on the shooting success in handball.

Objectives: The main objective of this work is to find out whether the place where the match is taking place affects the shooting success from individual player areas, and also the overall shooting success of the selected team. Another objective was to find out whether the place has got an effect on the result of the match.

Methods: For data collection we used the methods of direct observation, indirect observation and analytical method in our work. The results were processed using the Mann Whitney test, Wilcoxon test and Mc Nemar test.

Results: We found out that the place at which the match is taking place does not affect the overall percentage success rate of shooting of the selected team. Also it was not statistically proved, that the place affects the percentage success rate of shooting even from one of the basic areas of player functions for the attack.
