

## ABSTRACT

In this study we are verifying applicability of the tool BNAT for the target group of people with severe, multiple disability and autism in social residential facilities. Next we comment the tool.

The research has been conducted by means of interviewing primary care workers. Based on the results of qualitative analysis of interviews we had commented BNAT tool and suggested adjustments, leading towards usability in residential facility conditions, considering target group.

The contribution of the study is based on verifying of practicality of the tool that is mapping the needs of users in the moment of loss. The significance is foremost for workers who lead individuals with intellectual disability through the loss of the loved one.
