

**Abstract:**

New synthetic drugs are a new phenomenon that is expanding in many countries. NSD mimic the effects of traditional drugs phenomenological, but retain the hallmark of legal substances. NSD legal status is due to the fact that these new substances are controlled by the United Nations Single Convention on Narcotic Drugs of 1961 or the UN Convention on Psychotropic Substances, 1971.

To the Czech Republic this trend came somewhat later than in neighboring countries, and especially in 2010, when sales NSD was mainly in shops. This sale was completed in April 2011 because of entering 33th NSD to the list of psychotropic and narcotic substances and moved mostly to the internet.

NSD composition is often changing, due to disabling preparatory material, it follows that the risks associated with the use of NSD are unpredictable.

The research objective of this study is to determine the acquisition and distribution of NSD between problem drug users and also to map the most widely used NSD among this population. The main purpose of the research is to bring knowledge (as it's called, how it look, what it contains, where and from whom it receives, how much it costs).

The survey was made up of semi-structures interviews (qualitative part) and structured questionnaires (quantitative part). Respondents were selected clients on centers and outreach programs. The total number of respondents was 270, while in the qualitative part received 36 respondents.

Ways of acquiring NSD are many, but thanks to semi-structured interviews came to a specific type of sales NSD, unlike traditional drugs, so-called. Telephone meetings, where the price is stable compared to NSD. NSD where the prices is stable compared to the purchase at the composition NSD respondents were short, also circulated among speculation about the possibility of poison content in NSD. Information about packing NSD entirely absent, some respondents reported some type of information on the packaging of NSD stone shops before they were closed. NSD names are different and vary as well depending on location, but in all devices with varying degrees appeared Funky name. Legal status NSD respondents knew more, but it did not set any value.
