Amber in Bohemia in the Bronze Age - Abstract

Amber found in archeological contexts like any sensitive instrument can show the total span of meanings of different historic, economic, cultural, cult, and social traditions and systems of values in the prehistoric Europe. The work synthetically analyzes and evaluates the presence of amber finds in Bohemia during the Bronze Age. Attention is devoted relations to sites and amber artefacts demonstrating the probable course of “amber route”. On the path leading from the Baltic coast to the Balkans and Italy and further into the eastern Mediterranean seen as a string, or rather a network of relations, most malleable and flexible, distributed among communities, which is also subject while reflecting internal and external influences, changes and developments. It reflects new amber artefacts and new results of IR spectroscopy. Its results shows, that amber did not came to Bohemia only from the north - from Baltic region; its results proved also rumanit amber. Work is a comprehensive evaluation and interpretation of participation Bohemia in the distribution network of leading amber in the wider European area. Study of the amber and its distribution gives evidence, that there existed vivid exchange, based on variety of connections with distant region sof northern Europe and of the Mediterrannean, as well as strong cultural and economic relations among different communities themselves.
