

The Health Care Costs Analysis of Policyholders of VZP ČR

Abstract

The main objective of this thesis is an analysis of VZP ČR policyholder`s health care costs in terms of sex, age and regions. The analysis was performed by calculating the average health care cost according to given points of view. The analysis of variance was applied during a research of costs in terms of regions and it examined if there are statistically major differences in costs of health care in each region. There is a theoretical chapter before the practical part of this thesis, which links terms and definitions with medical care and it`s costs. In this thesis there is also a description of the historical development of medical insurance on our territory and an identification of the economic aspects of health care and the medical system. The statistical analysis for this thesis was done in statistical software IBM SPSS and is based on unique data file. The datas from regional analysis were drawn using the program ArcMap.
