

**Abstract:**

This thesis, using the quantitative data, studies the correlations between delinquency of juveniles and free time. In the beginning study focuses on the definition of the core terms such as juveniles, delinquency and free time, as well as presents some of the theories in which the subsequent data analysis is based on (situational theory of Per-Olof H. Wikström, the theory of social bonds of Travis Hirschi, the common theory of criminality of Hirschi and Gottfredson, theory of procedural justice of Tom R. Tyler and the theory of institutional anomie of Steven F. Messner and Richard Rosenfeld). This thesis furthermore presents select surveys on the delinquency of juveniles.

The next section contains the methodological basis such as the method of self-reported inquiries and the IRSD 3 research for data analysis.

The last chapter of this thesis is reserves for the evaluation of the free-time activities of individuals without family and friends and the difference from other groups, the difference between the delinquency caused by loners and other groups and finally the profile of the loner type based on other criteria such as gender, age, morality and self-control.
