ABSTRACT

This thesis will work on implementing the Political Economic Theory of Wall Construction on the case of Saudi Arabia. To further contribute to the study of border walls, the PETWC is applied to a different methodology than in the original paper where it was first introduced, taking into consideration neighboring countries without border walls into analysis. Ultimately, the thesis will show that PETWC sets good foundation for further development of a broader border wall theory, and that border walls concerning Saudi Arabia are consequence of low regional integration and internal instability at home and abroad.
