Abstract

This bachelor thesis deals with online lending system for digital media - Onleihe platform, which is the most widely used system of its kind in German-speaking countries. The thesis is divided into two parts. First part elaborates on general matters of system functioning, its content offer, technological security and technical requirements for the system usage. Second part presents the functioning on a specific example – the only library in the Czech Republic that offers Onleihe. A part of this segment is a quantitative questionnaire survey on that library’s user satisfaction with Onleihe. Recommendations based on the survey were formulated to improve the system functioning.

Key words

electronic books; Onleihe; electronic media; loans; library systems
