This project aims to create an application for the mobile system Android which with the help of augmented reality will show the user a route consisting of points/arrows, which represent the direction to follow. The application provides the users with possibilities to create or traverse routes. Routes can be branched at certain locations depending on the answer to a question. The application will be supplemented with a server to allow sharing information between multiple users. The application will also present the option to play the game with multiple users where users traverse the same route in order to achieve the best time.
