

Public registers in Czech Republic and their usage in demography

Abstract

The aim of this thesis is to introduce registers in gestion of ministries and other government bureaus and compare collected data in these registers with the ones collected in census. From the comparision results was designed process and methodology to replace census using paper forms with automatically collected data from registers or at least reduce the number of questions filled in the forms. With respect to huge scale of different registers used in Czech Republic, the selection of registers was conditioned with their connection to census collected data. Such registers are described with their function, collected data and their connection to census. It is clear, that this possibility is viable for main part of collected data, for the other part additional survey is still needed.
