Currently, pregnant women have a lot of possibilities regarding searching tests which can reveal possible existence of congenital malformations of an unborn child. Medicine and laboratory techniques development is moving very fast. This raises the question to what extent the available tests and techniques can affect psyche of pregnant women.

The bachelor's thesis is focused on awareness of pregnant women regarding screening tests in pregnancy. Furthermore, it deals with areas of life which are most affected by prenatal diagnosis. The thesis compares quality of life between healthy, pregnant women and pregnant women with a genetic load.
