Abstract

Energy security is currently a favourite topic. It is being talked about in the context of several conflicts in Third World countries that, due to the supply of energy raw materials such as oil and gas, affect the rest of the world. For some states, however, the issue of ensuring energy security is a more vital. Some states, such as the Baltic countries - Estonia, Latvia and Lithuania, are dependent on supplies of fossil fuels from neighbouring countries. Moreover, up until recently their energy markets have not been liberalized, nor connected to the rest of the Europe. It is a well-known fact that the Russian Federation is the main supplier of these raw materials to them. Therefore, the Baltic states have been trying to reduce the influence of the Russian Federation in the Baltic region since they regained independence 26 years ago.

This diploma thesis deals with the analysis of the energy security of all three Baltic countries. The thesis carefully analyses all aspects of their energy sector. It examines the historical development of the region, thanks to which we can understand the influence of the Russian Federation on the Baltics energy sector, as well as the level of international cooperation of the Baltic states with the EU in ensuring energy security. The analysis also focus on the relations among the Baltic countries and the energy policies they have chosen for their energy sectors.

The SWOT analysis was chosen as the research method to help identify the strengths and weaknesses of the Baltic countries as well as identifying the opportunities and threats these countries face. Based on the result of the analysis, the conclusion of the thesis is highlighting favourable strategies how to increase the energy security in the region.
