

ABSTRACT

The thesis aims to investigate the influence of situational parameters on the choice of lexicogrammatical units of language producers. The main focus is placed on the register of language and individual aspects of it are introduced. The phenomenon of human language use is approached specifically from the point of view of sociolinguistics in order to prove the importance of the role of language in social interaction. The practical part of the diploma thesis is dedicated to the multiaspectual analysis of three authentic discourse samples, which differ from one another in the contexts they take place in. Based on the proportion of individual parts of speech in each of these samples, a scale of formality is finally designed in order to determine the most and the least formal of them.
