

Abstract

Costs of civil proceedings

This dissertation thesis is aimed onto costs of civil proceedings, especially general costs of civil proceedings and special costs of civil proceedings. Regarding to the special costs of civil proceedings it deals with its remuneration (amount and extent). Existing Czech law was analyzed on given cases with comparison of law, economic analysis of law and theory of games and as the result the externalities were found and defined with the consequences the law lead to. The application of game theory on given problematics has shown its value for analysis of legal rules and as for future it is a way where the analytics can develop. The dissertation thesis has found a mathematical formula for calculation of summary remuneration of costs accompanied with lawsuits so that for the creditor it is more economical to sue the debts than to cede them to the debt collecting companies, and together with that the new law is proposed to prevent externalities that destruct the functioning of civil courts by flood of multiply-lawsuits and externalities, that's costs are borne by tax residents.
