ABSTRACT:

The thesis explores a biological and social factors of ice hockey players at various performance levels in the category of men. Defines the differences in values that arise from these factors when changing the performance level and building a team. The work also characterizes the construction of the team in terms of basic biological and social indicators, defines the profile of the player that is characteristic for performance level. The thesis explores basic biological parameters of the player, assumptions for sport performance, especially from the point of view of somatotype. It also learns about the social problems of sport, the characteristics of the sports team and it is engaged in organizing ice hockey competitions, especially by canceling some junior category competitions and by reorganizing competitions of the regional men's league.
