Abstract:

This study analyses the concept of The Environment among Czechoslovak architects and on the field of architectural theory in the 1960s. Environmental problematic was frequent topic across different expert groups since end of the 1950s and especially in the 1960s. Architects was one those groups and they actively further developed this concept of The Environment and environmental problematics during 1960s. This effort had brought interesting theoretical concepts and ideas and was also influenced by general Czechoslovak intellectual milieu of 1960s. Architects also started to critically address the degradation of natural environment due to increasing industrial pollution. They also accomplished several successes on the field of environmental problematics. They managed to establish specialized field of study and played a key role in some international conferences and meetings dealing with environmental problems under UNESCO, OSN or International Union of Architects. This study indicates some of yet not well known intellectual riches of Czechoslovak 1960s and also points that continuous environmental degradation during the reign of communist party was not caused by insufficient expertise and the source for this major problem should be further researched.

Key words: Architecture, Environment, environmental problematics, experts, Czechoslovakia, state socialism, 1960s
