In my diploma work, I elaborated a suggestion of a project on the subject of „Waste Products, Plastics and Environmentalism“. The project is determined to high school students and contains theoretical and practical part. In the theoretical part students improve their knowledge about manipulation of plastics and separating of waste which they will dispose at elaboration of posters. The practical part insists on laboratory skills and simultaneously on exercise of knowledge acquired in the theoretical part.

My project was launched in the fourth grade (the school has six grades), concretely on secondary school Jana Nerudy in Prague. It turned out, that this kind of lessons is very acceptable for topics which are linked by ordinary life. The project proved competent in the sphere of school subjects integration. Working in groups proved acceptable in this event.
