

Abstract

Title: : Analysis of squash match, comparison between male and female players

Objectives: This thesis shall compare different types of service, returns and third shots and their combinations between male and female players and estimate their usage and average success rate in professional squash matches.

Methods: Indirect analysis – videoanalysis

Results: Most used serve for both sex is backhand serve and three-wall serve, most used return is volley straight back and cross back, third shot was mostly directed to left side of the court. Better chances of winning had female players directing return straight back, men had better chances directing return cross back. In professional squash is minimum returns directing straight front, cross front and boast.

Keywords: Squash, service, return, direction, tactics, typology of players, comparison, male, female, notational analysis
