

Abstract

The thesis deals with the problematic of revitalisation related to brownfields in the selected administrative units of South Bohemian region. The case territory includes the municipality with extended powers of České Budějovice and the municipality with extended powers of Prachatic. Those case territories differ in few elements, mainly in regards with vertical and horizontal geographic position. The purpose of the thesis is to analyse how the rural brownfields are utilised, the thesis also focuses on the way stakeholders cooperate with each other during the revitalization of the brownfields. The methodology of the thesis is based on brownfields evaluation in the above mentioned territory, followed by a detailed analysis of the recovery issues by interviewing local stakeholders. The interviews were held with representatives of privat and public sector in the selected municipalities, where the brownfields were located. After evaluating the results for individual municipalities with extended powers, a comparison was done based on witch some regularities were found. The results of the research confirmed the hypotheses about the differences in interconnections between public and privat sector in different municipalities with extended powers. The hypothesis, assuming differences in the way of utilization of individual brownfields depending on their position in the region and in the municipality, was partially confirmed. The hypothesis, assuming differences in the intensity of interest in utilization of the brownfields influenced by the parameters of brownfields, was partially confirmed as well.

Key words: revitalization; public administration+ development; rural brownfie
