

My diploma work deals with the moving activities, which are the component of the life of the children till 6 years of age. The aim of the work is to find how much time use the pre-school child for spontaneous and controlled movement in the family and in the kindergarten. I was interesting, if there is any difference between the moving activities in the villages, in the suburb of the Prague and in the centre of the Prague. According to my investigation the differences were minimal.
