ABSTRACT
The topics of this master thesis are mainly findings on speech-therapy and the treatment of stuttering - stammering in the Czech and foreing reference literature. The work is divided into four chapters; three theoretical and one practical. The first theoretical chapter deals with stuttering-stammering, defines the basic concepts, deals with its etiology, symptoms and expressions, classification and division. The second chapter summarizes findings of balbuties in the Czech literature. The third chapter summarizes findings of balbuties on diagnosis and therapy in the English written literature. The fourth chapter is empirical and it is a quantitative empirical survey. The main method of data gathering was an online survey. The main purpose of the survey was to ascertain which methods and techniques are used when treating stuttering-stammering in the Czech Republic and in the Great Britain. The sub-chapters of the empirical part represent the scientific goals and chosen hypotheses, used methods, an actual processing of the quantitative survey and outcomes of the survey.
