ABSTRAKT

I chose the topic for my diploma thesis „The Excursion for the Elementary School Pupils along the Riverside of the Vrchlice River Aiming at Woody Plants“. I took that topic intentionally just for several reasons. I wanted to bring a scenic valley of the Vrchlice river to pupilsˇ attention, to make the identification of woody plants more attractive in the natural scientific excursion, and to consolidate pupilsˇ relation to nature and neighbouring environment.

The first theoretical part deals with the general description of this valley and at the same time with the characteristic of animals and plants. Selected sorts of woody plants are described in the most detailed way as they became initial ones for working out worksheets and for the natural scientific excursion.

The next part of the diploma thesis concerns inquiry research the goal of which was to find out the interest of teachers from nearby basic schools in worksheets dealing with the woody plants issues of the river Vrchlice.

Worksheets dealing with selected wooden plants were elaborated on the basis of the research assessment. Those worksheets were verifield in the follow-up excursion.

The closing part evaluates whether all the set targets were accomplished.
