

## **ABSTRACT**

The aim of this study is to prepare and verify a molecular biological teaching cycle. This cycle is focused on hands-on activities, critical thinking and student's activity. A total of 99 pupils from two elementary schools (9th grade) and one multi-year grammar school (equivalent to primary schools) participated in the verification. They helped to create an attractive learning cycle from molecular biology, which can be used directly without major modifications and low cost.
