

Comparison of the use of reclaimed areas in the North Bohemian Brown Coal Basin for the needs of recreation and tourism

Abstract

Revitalization of industrial areas in the form of recultivation has been on the increase in the last several years. The recultivated sites are becoming significant regions for tourism. This bachelor's thesis is a comparative study of recultivation projects in the North Bohemia brown coal mining region. The goal is to evaluate the recreational function of selected recultivation projects. Further determined were the types recultivation, area of the recultivated region, and the type of area utilization. Also, an analysis of web pages was made with the target of comparing promotion and engagement of the public and private sectors in the examined recultivation projects. The work evaluates activities of interest and attractions in the areas. The first part of the work includes a list of literature and terminology. Also described are the individual recultivation projects. In the last part, projects are evaluated within the framework of activities of interest and attractions and the importance for the tourism.

Key words: reclamation, tourism, recreation, North Bohemian Brown Coal Basin
