

## ABSTRACT

The aim of my bachelor's thesis is to monitor the diet of the Long-eared owl (*Asio otus*) in wintering grounds in selected localities in the Central Bohemian Region in the vicinity of the Kladno district. These are two localities that have been monitored before, so I continue on previous work with the same focus. The main focus is the collection, analysis of discards and its methodology. I also deal with the change of food of the eared owl during a certain period with a focus on the winter phase in connection with the temperature and the total precipitation in the given localities. The work also deals with the comparison of the results of monitoring the composition of the diet of the Long-eared owl in the same and other localities from previous research.
