

In my bachelor's paper, the classic nursing process is elaborated; its theme that is particularly topical currently is a patient with intestinal tumour.

The reason why the theme "colorectal carcinoma" was chosen is described in the preamble: it is mainly the current high frequency of this diagnosis. The numerical comparison of its incidence and mortality in the Czech Republic and worldwide are described here.

The theoretical part deals mainly with anatomy and physiology of large intestine, factual disease, its diagnostics and therapy. Basic information related to the patient, course of his hospitalization, and the used therapy are also described here.

The practical part deals with the actual nursing process; case history of illness and diagnosis that was elaborated on the basis of subjective and objective information gained during the patient's treatment are described in this part.

The closing part summarises the overall hospitalisation course and future prognosis of the patient.
