

VETERINARIES REGISTERED IN THE CZECH REPUBLIC – DEVELOPING TRENDS

Michaela Mitášová

Abstract

The aim of this dissertation was to make a summary of veterinary medical preparations registered in years 1995 – 2006 in the Czech Republic. Individual preparations were reviewed in these categories:

1. Registry number and the SUKL code
2. The land of producer
3. Drug form
4. Indicating group
5. Animal species to which the drug is intended for
6. Newly registered medical preparations

We were comparing the period of years 1995 – 2000 and 2001 – 2006. The head task of this dissertation was to map out developing trends in individual categories.

As the main source for getting data we used the AISLP programme. For the period of years 1995 – 2000 it was version 2000. 3 actualised by 1. 7. 2000, for the period of years 2001 – 2006 it was version 2007. 2 actualised by 1. 4. 2007.

After we got all necessary information we made a conclusion that in years 1995 – 2000 there is a considerable fall of registration of preparations. On the contrary in years 2001 – 2006 there is mild increase with the maximum of registration of preparations in 2004 and following intense fall. The rise of the registration of preparations was caused by increase of number of newly registered effective preparations in different drug forms and increase of number of lands manufacturing veterinary preparations which were registered in the Czech Republic. On the contrary the fall of registration could have been caused by discarding of some of effective preparations from registration. These falling trends can be watched in all categories.

A new drug form appeared – surgical implant, the year of registration 2003. In the area of index groups there were registered mainly antibiotics,

antiparasitics, imunopreparations, medicaments for alimentary tract and metabolism and system chemotherapeutics, the least medicaments for special animal species, stimulative drugs and stimulants of growth and productive utility, medicaments for respiratory and cardiovascular system. It also becomes to delete the registration of preparations of these index groups: homeopatics, invigorating drugs and stimulants of growth and productive utility, preparations for fish and bees, microbotics and probiotics, medicaments for cardiovascular system.

In the area of definition to individual animal species there were mostly preparations registered for wiser designation, small carnivores, poultry, pig and ruminants. There also appear preparations defined for rabbits only.

The number of newly registered effective preparations fell down from 71 in 1995 – 2000 to 31 in 2001 – 2006.
