

## Annotation

This work deals with analysis of knowledgements of general nurses in nurse approach to MRSA positive patients. 120 nurses from infectious clinic, gerontometabolic clinic and surgeon clinic of Teaching hospital Hradec Kralove were asked by questionnaire. 87 answer sheets were elaborated. The result acknowledged a good level of knowledges, but it detected deficiencies of practical abilities. Limiting factors are conditions of health institutions within providing of care and ignorance of some special nurse techniques – isolation in cohort, rigorous barrier nurse system on bed, recommended by WHO safe hospital methodology.
