

Annotation

The paper deals with life quality of patient with colostomy. It is composed of a theoretical part and an empirical one. In the theoretical part there is global information about colostomy. In the empirical part there is information about research and its outcomes. In research there were explored changes in lifestyle, limitations and other factors that arise from performance of colostomy. In the second part of research there is explored the nursing quality of multidisciplinary teams in connection with colostomy. And at the end of empirical part there is explored market with stomical aids - there is explored sphere of quality, accesibility, and suitability of using.
