

Abstract

The diploma thesis named „The system of providing of medical and physiotherapeutic care for adult physically disabled people in the Czech Republic: The connection among medical and physiotherapeutic care, integration and the quality of life“ maps a particular kinds of medical and physiotherapeutic services provided (it includes for instance ambulatory physiotherapy and bath medication) and offered by the system to the people with physical impairment. The data were obtained from qualitative interviews made with patients and also with specialists who works on in the field of medical-physiotherapeutic and social care. The autobiographical method was also used during 4 the research. Each kind of the care provided are valuated by patients - recipients of the care and and by specialists - persons who provide services. We especially focused on the number, availability, frequency and quality. We followed namely the possibility of getting and need of each kind of a medical-physiotherapeutic service: it's sequence and it's involvement to the possibility of the integration and the quality of life of the people with a physical impairment. Using the method of the tree of problems the data were organized and evaluated. There were identified problematic parts of working of the whole system and outlined some possibilities of its solution within the area of public and social policy in the conclusion.
