

My Diploma work focuses on the concept of Basal stimulation® and its practical application in the treatment of people with disabilities. The theoretical part briefly introduces the basic concept of Basal stimulation®, describes the history of its beginning and development, then deals with the way people accept individuals with several disabilities, as well as those with mild forms of disability. The following part of my work analyses the characteristics of each part of the stimulation: somatic, vibratory, vestibular, optical, acoustic, oral, related to smell, tactile. The practical part describes the use of basal stimulation for people with disabilities. This part includes the results of a research questionnaire on the use of the stimulation for pupils with several disabilities case history.
