

Title:

Ergotherapy as a part of rehabilitation and its impact on the quality of life

Aim: Describe to ergotherapy, its insertion to the rehabilitation, and try to find its impacts on the quality of life of people, who are bounded to a wheelchair.

Objektive: Studying relevant literature

To describe the ergotherapy

To describe the diagnose of the spinal handicap

To describe the term – the quality of life

To choose the complex of the suitable respondents

To choose methods of observation

To make a research

Hypothesi: I suppose that ergotherapy has impact on the satisfaction with the quality of life of people, who are bounded to a wheelchair.

Methods: It is empirical study, in light of range pilot, in which is used the quantitative methodological access.

I have chosen the following methods of observation.

Questionnaire: a standardised questionnaire - Questionnaire of the quality of life

Obtainment of the opinions on the activity in the thread workshop: Interview.

Examination of self-sustainability and independence – for assesment of progress the respondents in this area.

Grasp test – for assesment of progress the respondents in grasp skills and in training of writing.

Result: Hypothesis „I suppose that ergotherapy has impact on the satisfaction with the quality of life of people, who are bounded to a wheelchair“, has been certified.

Key words: ergotherapy, spinal handicap – quadroplegia, quality of life, selfsustainability and independente, grasping, activities in the workshops
