

Abstract

Legal regulation of the protection of plants and animals

The subject of this thesis by the title „ Legal regulation of the protection of plants and animals“ are selected, the most significant legal standards, laying out the problematic of fauna and flora protection and their analysis in order to create a comprehensive scope of fauna and flora legal regulation *in situ* both on international, European and domestic level of law. The thesis is divided into four parts. The first chapter introduces the structure and extensity of the fauna and flora protection problematic, whereas it contemplates over the term biological diversity. The next chapters successively describe the legal regulations of fauna and flora on the international, European and domestic level of law. The introduction is always there to mention historical development and related standards that have given the present legal regulation its form. It is followed by summary of the most significant standards of the legal regulation in effect. To conclude my thesis, I am summarizing and determining whether the system of legal standards in effect truly results in the objective of legal regulations of fauna and flora protection, primarily in stopping the decrease of biological diversity and its restoration in the future.
