

The aim of this bachelor thesis, Body scheme disorder effect in patients with scoliosis, is to introduce the terms scoliosis, body image and body scheme in terms of their history, definition, examination, disorders, and therapy. In the review of existing data it also analyses the relationship between body image disorder and emergence or development of scoliosis. Particularly, it represents the description of the area, whether body image disorder is one of the factors in etiology of scoliosis, or contrarily, on the basis of scoliosis emerges the body image disorder. Further, this work outlines brief descriptions of complications that affect a scoliotic patient from childhood through adolescence to adulthood, quality of life and limitations related to the issue of scoliosis. A case study of a patient suffering from the diagnosis can also be found in this thesis.
