

The goal of my study was to identify the most contagious job-related diseases and to find out the leading cause of infection spread among graduate nurses working in an ICU and resuscitation ward in the hospital. My intention was to find out core safety standards on specific ward, if it is kept at disposition and every nurse practitioner is familiar with it and precautionary measures have been obtained.

Theoretical part focuses on dilemma of job-related infectious diseases (professional inf. diseases) and describes terms related to this problem.

Empirical evidence concentrates on results of applied research. Obtained information are the basis of further specified goals and hypothesis verification.
