

The theme of my labour is an adolescents' and pubescent's motivation of sport.

My aims are: to check that working out of students and pupils is affected by parents, to find out the most frequent reasons why students do sport and if sport offer of school affects frequency of students' working out.

Pubescence and adolescence are the period of life ,when the formation relation to sport closes and ends. There are no significant changes during other stages of life. I'd like to find out what is the relationship of youth to sport like and what are the factors supporting a positive attitude to sport.
