The thesis is focused on constituent negation and ways of its expressing in contemporary Czech, or more precisely in Czech National Corpus (SYN2005) and Prague Dependency Treebank (version 2.0). In most of the Czech linguistic handbooks, constituent negation was treated as such a negation that does not operate on predicate. The author offers a new definition of constituent negation in Czech, based on data research and study of relevant literature concerning syntactic negation. Further, the author proposes a formalization of the structure of constituent negation within the framework of construction grammar and she also explores the possibility to express the findings in PDT.
