

The general part of the work deals with basic information about the problems of carpal tunnel syndrome. Contains information anatomical, historical, pathophysiology, epidemiology, information on diagnostic and investigative methods and treatment options for carpal tunnel syndrome.

In the special part of my work is investigative methods and physical therapy procedures for patients after surgery carpal tunnel syndrome should and can contribute to full recovery of functional abilities of the hand and the patient's return to full daily life.

The practical part describes the two-hospital rehabilitation of patients after surgery carpal tunnel syndrome.
