

A physical activity has an unfingible role for preschool children. It is approved, that well timed stimulation of physical activity of children has an important influence on whole life of a person. These stimulations create a custom of proper motional activities in adulthood.

I have concentrated on a determination of stimulations of preschool aged children motional activities. The watched group composes of 135 preschool aged children, which of them 49 children live and visit kindergarten in village, 39 children in small town and 47 in Prague. To collect all data,
