Ing. Jitka Vodáková, CSc.

ABSTRACT:

In the theoretical part of this work I was paid the most concise summary of scientific findings on the general theme of creativity and its separation from various angles. In the practical part, I then conducted research with Torranceho creativity tests, which aimed to identify and record the progress and development of creativity in a selected sample of students in primary school, which has been for four months, targeted action. Hypothesis only visible shift in receptive students has not been confirmed. Better test results were found for most students. It surpassed my expectations. Targeted activities for pupils and proved to be a suitable way of developing creativity.
