

**Abstrakt v anglickém jazyce:**

This bachelor thesis deals with processes of nominalization in French scientific and popularization articles on chemistry. In order to examine processes of nominalization in French scientific texts, this study first analyses the scientific genre in general, characterizes its stylistic standards and describes the system of its inner differentiation (scientific genres and popularization genre). The main part of this thesis is then focused on processes of nominalization in French scientific texts, more specifically on the transformation from verbs to nouns. The outcomes of the theoretical part are verified by means of quantitative analysis which is realized on a corpus of scientific texts on chemistry in selected substyles. Since the concerned discipline belongs to natural sciences, these texts are found to be more formal.

**Klíčová slova:** nominalization, scientific genre, popularization genre, French
