

## **Abstract**

Viral hepatitis - knowledge of upper grade high school students

This thesis is focused on the issue of all types of viral hepatitis. The work is divided into two large units. The first part is theoretical and provides a comprehensive overview of all types of viral hepatitis in general. It deals in detail with each type separately; it describes its characteristics, what causes it, its epidemiology, course, diagnosis, treatment and prevention. The empirical part investigates the level of knowledge of students of third and fourth grade of high schools from a quantitative survey. It includes pedagogical research, whose task was to determine what knowledge students had acquired during compulsory education, and it also includes evaluation of this research.
