

Abstract

This thesis of theoretical-experimental character deals with violence in healthcare facilities, first of all at the anaesthesiology and resuscitation departments and intensive care departments. A theoretical part of the thesis describes types of violence, factors leading to the violent behaviour and their consequences. Further there are mentioned the possibilities of prevention of violence in the working place. A research part contains an analysis of a questionnaire survey. It was aimed especially at the real state in selected departments, types of aggressors and frequency of occurrence of attacks.
