

**Abstract (in English):**

The master thesis analyses the relationship between scholarly communication and libraries and information institutions in the Czech Republic on the basis of information received from research. Primarily it is focused on the promotion of science projects. At the beginning, scholarly communication and its three parts are defined – professional text, professional speech and promotion of science. The main part of the thesis is the research itself. The results of the research are described there and also the way of promotion of science in selected Czech libraries and information institutions. Furthermore, model projects promoting science in which libraries and information institutions participate are introduced. The final part describes the trends in scholarly communication and the possibilities of scholarly communication support available to libraries and information institutions, in particular the promotion of science [Author's abstract].
