

Abstract

This bachelor thesis deals with physical-geographical researches about High Tatra Mts published in 1969 - 2008. It compares recent knowledge about nature of High Tatra Mts. with knowledge published few decades ago. This work describes the most important researches. It also describes this mountain range within its geomorphological, hydrological, climate, soil and other features.

High Tatra Mts. build an exclusive complex of landscape natural components. Lots of landform factors in small area and vertical zonation with variable characteristics makes this area a good model for geographical studies.

Key words: physical geography, High Tatra Mts.
