

Topic of diploma thesis	Novel approaches for treatment of diabetes mellitus
Student's name	Katerina Hadjiyangou
Supervisor	Prof. PharmDr. František Štaud, Ph.D.

I. Supervisor's appraisal of Katerina Hadjiyangou

Katerina Hadjiyangou has elaborated a diploma thesis named „Novel approaches for treatment of diabetes mellitus“. In her work, Katerina covers many aspects of diabetes mellitus, including pancreas biology, physiology and pathophysiology, etiology of diabetes mellitus and its risk factors. The main focus of the diploma thesis lies in the treatment strategies, covering traditional as well as latest approaches.

While working on her diploma thesis, Katerina was a very active and reliable student. She has assembled a large number of recent publications and other information sources and incorporated them into her thesis. She was willing to accept my advice and criticism, but she also brought up many interesting points of her own.

Classification **excellent**
