

ABSTRACT

β -N-acetylhexosaminidase from tobacco leaves (*Nicotiana tabacum* L.) was partially purified to final specific activity $1,72 \mu\text{mol} \cdot \text{min}^{-1} \cdot \text{mg}^{-1}$ using p-nitrophenyl- β -N-acetyl-D-glucosaminide as substrate. The enzyme exhibited one band after both isoelectric focusing and native electrophoresis. Molecular mass of native enzyme was determined by gel chromatography (M_R 275000) and native electrophoresis (M_R 285000). Isoelectric point pI 5.4 was determined by isoelectric focusing. Activity of β -N-acetylhexosaminidase was measured using substrates p-nitrophenyl- β -N-acetyl-D-galactosaminide, p-nitrophenyl- β -N-acetyl-D-glucosaminide, N,N'-diacetylchitobiose, p-nitrophenyl-N,N'-diacetylchitobioside and N,N',N''-triacetylchitotriose. For substrates N,N'-diacetylchitobiose, p-nitrophenyl-N,N'-diacetylchitobioside and N,N',N''-triacetylchitotriose an enzyme assay of β -N-acetylhexosaminidase using capillary zone electrophoresis was developed. Optimal pH and temperature of β -N-acetylhexosaminidase were determined with individual substrates, as well as products of hydrolysis. Activity of β -N-acetylhexosaminidase was highest using p-nitrophenyl- β -N-acetyl-D-glucosaminide as substrate and lowest using N,N',N''-triacetylchitotriose (35% in relative comparison). Maximum velocity and Michaelis constant of β -N-acetylhexosaminidase were determined with substrates N-acetyl-D-galactosaminide, p-nitrophenyl- β -N-acetyl-D-glucosaminide and N,N'-diacetylchitobiose. Substrate inhibition of β -N-acetylhexosaminidase by p-nitrophenyl- β -N-acetyl-D-glucosaminide was observed, for the first time in plant β -N-acetylhexosaminidase studies. The inhibition effects of D-galactosamine, D-glucosamine, N-acetyl-D-galactosamine and N-acetyl-D-glucosamine on the activity of β -N-acetylhexosaminidase were determined.
