# Regional differentiation of gender patterns

## Abstract

It is common nowadays to view the problem of gender from all angles, but until now it has not been considered from a regional point of view. This dissertation focuses on the regional differentiation of gender patterns. The object of this dissertation is to show the biggest diferences between men and women from a regional standpoint by the use of selected indicators. This entails considering the selected gender patterns in distinct districts. As a suitable data basis for this survey  results from the last two censuses were chosen, the criterion being permanent residence in an area. The dissertation focused on study of patterns of gender characteristics and their changes between the last two censuses, which took place in the Czech Republic, SLDB 2001 and SLDB 2011. In the first part the indicators are presented for the whole of the Czech Republic. Then follows an analysis of changes in the levels of the chosen patterns between individual censuses and then their structural transformation. Then the dissertation looks at the regional view in more detail. The last part focuses on the creation of district typology in the Czech Republic according to the most important patterns.
