

Do MUDr.Doležala surgery I got in compulsory optional course "Children and adolescents with disabilities" kept MUDr.Palyzovou. This internship I was intrigued, so I have the theme of my thesis so i chose to deepen their knowledge and ability to monitor the psychomotor development of the child, his disorder, and I knew (and could further recommend) the possibility of preventing the development of these disorders.

Research on the effectiveness of Vojta reflex locomotion methods discussed in many authors before me, and their results speak in favor of this method (this the experimental study). My work deals with diagnostic tests - positional response of the child. In the event that the response does not correspond to a given position developmental stage at which the child according to his age should be, it is appropriate correct the broken motor development as just Vojta, we prevent later complications. It is of course necessary to monitor psychomotor comprehensive child development - how it manifests itself spontaneously, what has reflexes sval.tonus, corresponds to the position of individual reactions. Postural reactions to some benefits - are not influenced by the current mood of the child in the office (they are always the same) and their use can be determined motorized vulnerable children earlier than would be they can be diagnosed using other monitored parameters. The default is 7 uses positional reactions. I would be interested in their sensitivity and specificity.
